

Code Viewer

The Code Viewer allows you to display:

- HTML
- Javascript
- PHP
- Or Python

The code displayed will automatically colour based on the language selected and provides linting assistance to automatically add closing tags, quotations and highlight errors.

To input some code, click the **Edit Code** button in the Edit Panel

The widget only displays code, it **does not run the code**. If you wish to demonstrate your programming, then the HTML widget can run HTML, CSS and Javascript.

The widget can have a title set in the Edit Panel, which can be useful for highlighting steps or different elements.
