

Collecting Computer Code from students

For Computing, it can be quite awkward to collect programming from students. Firewalls and virus-checkers will routinely block code from being submitted via email.

To help with this, we built the **Basic Code Activity**

Fill out the Assignment wizard as usual, and on the **Activities Tab**, choose Basic Code Activity.

You can **name the activity** – to help identify it later if you are adding multiple items. In the **Language dropdown**, you can select different choices. This allows Frog to colour code appropriately.

The Basic Code Activity does not run code submitted – for security reasons.

You can add code into the Activity, to provide your students with code to modify and you can include Success Criteria:

When students open the assignment, they can adjust the code and save changes before submitting. Each time they save their changes it creates a new iteration of their submission which you can view by double-click in the assignment view.

The Feedback option allows you to highlight and annotate the code and leave audio feedback too.

Each activity has its own mark available if you wish to use it and you can then set an overall mark for the whole assignment
