MIS Linked Documents

If your school has uploaded some MIS documents to the Frog platform, you will be able to view them using the MIS linked documents widget. This widget will need to be used in conjunction with the select date widget as you need to define a date range so that the widget can then search for any documents created during these dates. I'll set my date range right back to the beginning of the September as I want to display all documents created in this academic year.

It's important to note that this widget searches for documents based on their creation date within the schools MIS database. This means that if the document was created in February but only uploaded to Frog in May, then you would have to use the select date widget to filter back to the creation date in February, not the date it was uploaded. If you are unsure about the date documents were created, you can easily select to view the whole academic year using the select date widget.

Double clicking on one of the documents will open it in the PDF viewer. From there, you can choose to download or print the documents.
